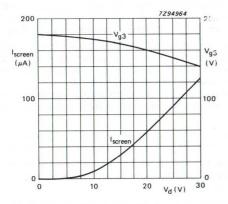

Fig. 5 Screen current (I_{screen}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_{d}); typical curves.

PHILIPS

INSTRUMENT CATHODE-RAY TUBE

- mono accelerator
- 12 cm diagonal rectangular flat face
- internal magnetic correction for astigmatism, vertical eccentricity and orthogonality
- low heater power consumption
- for portable oscilloscopes with up to 25 MHz bandwidth, and read-out devices

QUICK REFERENCE DATA

Vg2,g4,g5(l)	2000 V
	80 mm x 64 mm

MECHANICAL DATA

Dimensions and connections (see also outline drawing)

Overall length (socket included)

≤ 292 mm

Faceplate dimensions

 $98 \pm 0.5 \text{ mm} \times 82 \pm 0.5 \text{ mm}$

Net mass

approx. 0,7 kg

Base

12-pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Pin protector (required for shipping)

supplied with tube

Socket with solder tags

type 55594

Socket with printed-wiring pins

type 55595

Mu-metal shield

to be established

FOCUSING

electrostatic

DEFLECTION

double electrostatic

x-plates

symmetrical

y-plates

symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

PHILIPS

NOTES

- 1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule. application of an external passe-partout with open area of max, 82 mm x 66 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
- 2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean x- and y-potentials, in order to minimize tube adjustments. Under this condition g5 can be connected to g2, g4, and made equal to mean y-potential for optimum spot (see also notes 3 and 4). A difference between mean x- and y-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on gg (equal to mean x-potential) may be required.
- 3. The tube meets the geometry specification (see note 8) if V_{q5} is equal to mean x-potential. A range of ± 50 V around mean x-potential may be applied for further correction.
- 4. Optimum spot is obtained with V_{q2, q4} equal to mean y-potential (see note 2). In general a tolerance of \pm 4 V has no visible effect; V_{g2} , $_{g4}$ tends to be lower with V_{g5} more positive. The circuit impedance $R_{q2, q4}$ should be less than 10 k Ω .
- 5. An actual focus range of 30 V should be provided on the front panel. V_{q3} decreases with increasing grid drive (see also Fig. 5).
- 6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. 50 μA; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V) or for maximum acceptable line width. The corresponding cathode current or $I_{q2,q4}$ (up to 500 μ A) depend on the cut-off voltage and cannot be used for control settings.
- 7. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
- 8. A graticule consisting of concentric rectangles of 80 mm x 64 mm and 78.3 mm x 62.3 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
- 9. The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
- 10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of 185 \pm 25 Ω at 20 °C, which increases by approx, 0.4%/K for rising temperature. Approx. 5 mA causes 10 trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
- 11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_0 = 10 \mu A$.
