|  | $\max$. | 125 | V |
|  | $\max$. | 20 | V |

## NOTES

1) The mean $x$-plate potential and certainly the mean $y$-plate potential should be equal to $\mathrm{Vg} 2, \mathrm{~g} 4, \mathrm{~g} 5(\ell)$ (with astigmatism control voltage set to zero).
${ }^{2}$ ) When putting the tube into operation the astigmatism control voltage should be adjusted only once for optimum spot size in the centre of the screen. The control voltage will be within the stated range, provided the conditions of note 1 are adhered to.
${ }^{3}$ ) Measured with the shrinking raster method in the centre of the screen.under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\boldsymbol{\ell}}=10 \mu \mathrm{~A}$. As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5(\ell)}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but without raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$
Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{X} 2}=10 \mu \mathrm{~A}$
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control.

The screen current of the resulting raster display is now exactly $10 \mu \mathrm{~A}$.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
${ }^{4}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.

Notes see page 5 .

Note
The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of fhe $x$-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a resistance of $400 \Omega$. Under typical operating conditions, max. 30 ampere-turns are required for the max. rotation of $5^{\circ}$. This means the required current is max. 30 mA at a required voltage of 12 V .

## NOTES

1) The mean $x$-plate potential and the mean $y$-plate potential should be equal to $\mathrm{Vg} 2, \mathrm{~g} 4, \mathrm{~g} 5(\ell)$ (with astigmatism control voltage set to zero).
${ }^{2}$ ) When putting the tube into operation the astigmatism control voltage should be adjusted only once for optimum spot size in the centre of the screen. The control voltage will be within the stated range, provided the conditions of note 1 are adhered to.
${ }^{3}$ ) Measured with the shrinking raster method in the centre of the screen.under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan),
adjust $V_{g 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5(\ell)}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but without raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$.
Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{x} 2}=10 \mu \mathrm{~A}$,
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{gl}}$ control.

The screen current of the resulting raster display is now $10 \mu \mathrm{~A}$.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
${ }^{4}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5) A graticule consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times$ 73 mm is aligned with the electrical $x$-axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.
