### **INSTRUMENT CATHODE-RAY TUBES**

relen

- mono accelerator
- 14 cm diagonal rectangular flat face
- internal magnetic lens system for vertical scan magnification, orthogonality, astigmatism and eccentricity correction
- quick-heating cathode
- with or without internal graticule
- flat screen edges facilitate graticule illumination
- reference points on faceplate for graticule alignment
- for inexpensive oscilloscopes and read-out devices

#### QUICK REFERENCE DATA

Base

#### Mounting

Net mass

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

#### Accessories

Pin protector (required for shipping)	supplied with tube
Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595
Mu-metal shield	to be established
FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance delfection plate drive is desirable.

#### NOTES

- As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig.4).
- 2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean x- and y-potentials, in order to minimize tube adjustments. Under this condition g<sub>5</sub> can be connected to g<sub>2</sub>,g<sub>4</sub>, and made equal to mean y-potential for optimum spot (see also notes 3 and 4).

A difference between mean x- and y-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on  $g_5$  (equal to mean x-potential) may be required.

- The tube meets the geometry specification (see note 8) if V<sub>g5</sub> is equal to mean x-potential. A range of ± 50 V around mean x-potential may be applied for further correction.
- 4. Optimum spot is obtained with V<sub>g2,g4</sub> equal to mean y-potential (see note 2). In general a tolerance of  $\pm 4$  V has no visible effect; V<sub>g2,g4</sub> tends to be lower with V<sub>g5</sub> more positive. The circuit impedance R<sub>g2,g4</sub> should be less than 10 k $\Omega$ .
- 5. An actual focus range of 30 V should be provided on the front panel.  $V_{g3}$  decreases with increasing grid drive (see also Fig. 5).
- 6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. 50  $\mu$ A; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V) or for maximum acceptable line width. The corresponding cathode current or I<sub>g2,g4</sub> (up to 500  $\mu$ A) depend on the cut-off voltage and cannot be used for control settings.
- 7. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
- A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
- 9. The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
- 10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of 185 ± 25 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. Approx. 5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
- 11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current  $I_{\chi} = 10 \ \mu$ A.
