VALVE ELECTROPIC

CV5031

COUNTERTON

Specification M	os/cv 5031	SEC	URIVI	
Issue 1. dated	28.3.57	Specification	<u>Valve</u>	
To be read in co	onjunction with E.1001 s 5.2, 5.3, 5.8.	Unclassified	Unclassified	
ļ				
TYPE OF VALVE:	Magnetron	MAR	KING	
CATHODE: Indirectly Heated		See I. 1001/4		
PROTOTYPE:	M.548			
		DIMENSIONS AND	COMECTIONS	
RATIN	(v) 1 3.0 A.B.	See Drawing, Pa	ge 4 and 5	
Heater Voltage Heater Current Max.Peak Anode	(A) 3.5			

Notes

A. Full heater voltage shall be applied for at least two minutes before the application of H.T.

(kV)

kW) 150

(c)

0.001

- B. When operating at maximum input the heater voltage should be reduced to
- C. The temperature of the anode block shall not at any point exceed 140°C.
- D. In use the cathode lead side of the valve shall be adjacent to the North pole of the magnet

CV5031

To be performed in addition to those applicable in K.1001

Test Conditions		t Conditions	m		Limits		7.7 -

	k	-	_	Vibration				10 %	10 & 13
	1		-	Drop				10 %	11 & 13

Notes

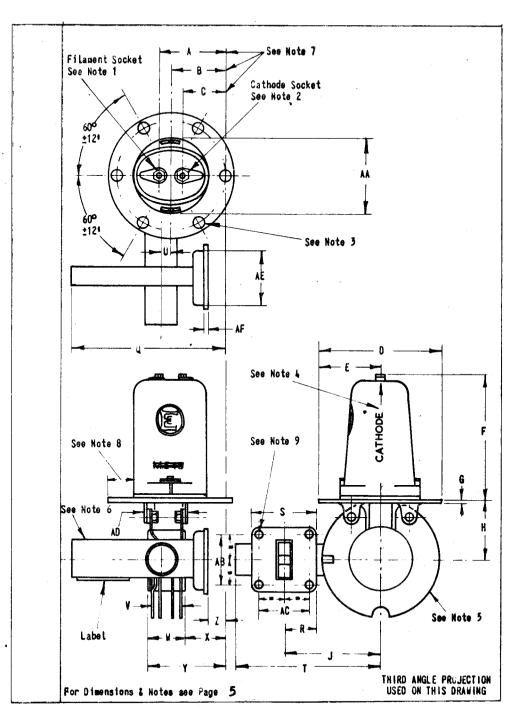

- 1. The heater current shall be measured not less than 360 seconds after the application of heater voltage.
- 2. Full heater voltage of 3.0 V shall be applied for not more than 120 seconds before the application of H.T. when the heater voltage shall be reduced within 5 seconds.
- 3. Measured with pulse length 1u.sec + 10%, duty cycle 0.001, magnetic field strength 3,800 cersteds + 2%. the rate of rise of the voltage pulse shall not be less than 150 kV/u.sec. when the valve is operating at 12 amps peak.
- 4. The waveguide shall be terminated in a resistive load giving a voltage standing wave ratio better than 1.10.
- 5. Measured with a voltage standing wave ratio of not less than 1.5 varied through all phases.
- 6. The spectrum width is not to exceed 3 Mc/s at the $\frac{1}{4}$ power points.
- 7. There shall be no sign of missing pulses nor serious deterioration of the spectrum when viewed on a spectrum analyser, nor double traces of voltage or current observed on an oscilloscope.
- 8. The difference between maximum and minimum frequencies in the range 10-12 mA is not to exceed 5.0 c/s.
- 9. The voltage standing wave ratio shall be not less than 6.0 to 1. The distance of the minimum from the reference plane shall be within the specified limits at the frequency recorded in test "d". The reference plane shall be 1mm distant from the magnetron coupling flange into the valve.
- 10. One valve in ten shall be mounted rigidly on a platform which will be vibrated with simple harmonic motion of 0.040" amplitude (total excursion 0.080") at a frequency of 25 cps. The cathode tube and support arm are to be at right angles to the direction of motion. The duration of vibration shall be 60 seconds.
- 11. One valve in ten shall be dropped in its normal approved packing 3 feet on to a concrete floor.
- 12. The valve shall be stored for 168 hours before this test. Stable operation shall be demonstrated over 30 seconds of a test period not to exceed 4 minutes after the application of H.T. Stability is defined as:-

Number of arcs

Total number of magnetron pulses in the test interval.

Arcs shall be recorded by an electronic counter which is adjusted to respond to current pulses more than 10% above the operating peak current.

13. The valve shall then pass the specification. In the event of a failure "the lot" shall be subjected to this test.
