SPECIFICATION M.O.A./CV.5847 ISSUE NO. 1 dated 2.7.62 To be read in conjunction with K1001, BS448 & BS1409	<u>SECURITY</u> <u>SPECIFICATION</u> Unclassified	<u>VALVE</u> Unclassified
--	--	---------------------------

TYPE OF VALVE: Double R.F. Beam Tetrode	<u>MARKING</u> See K.1001/4
CATHODE: Indirectly - Heated	
ENVELOPE: Glass, unmetallised	<u>BASE</u> BS.448/B7A
PROTOTYPE: QQQV07-50	

<u>RATINGS</u>			<u>NOTES</u>	<u>PIN</u>	<u>CONNECTIONS</u>
(All limiting values are absolute)					<u>Electrode</u>
Heater Voltage	(V)	6.3	A	1	Heater h
Heater Current	(A)	1.8	A	2	Control Grid (1) g1'
Max. Anode Voltage (f = 250 Mc/s)	(V)	750		3	Screen Grid (Common) g2
Max. Anode Voltage (f = 500 Mc/s)	(V)	600		4	Cathode k
Max. Screen Grid Voltage	(V)	300		5	Heater (Centre tap) h.c.t.
Max. Negative Grid Voltage	(V)	175		6	Control Grid (2) g1"
Max. Anode Dissipation	(W)	25	B	7	Heater
Max. Screen Grid Dissipation	(W)	3.5	B	TC1	Anode 1 a'
Max. Control Grid Dissipation	(W)	1.0	B	TC2	Anode 2 a"
Max. Heater-Cathode Voltage	(V)	100			
Max. Peak Cathode Current	(mA)	875	B		
Max. Mean Cathode Current	(mA)	150	B		
Max. Grid-Cathode Resistance (fixed bias)	(k $\Omega$ )	50			
Max. Grid-Cathode Resistance (auto-bias)	(k $\Omega$ )	100			
Max. Temperature of Anode Pins	(°C)	250	C		
Max. Temperature of Base Pins	(°C)	180	C		
<u>CAPACITANCES (pF)</u>					<u>DIMENSIONS</u>
C in (nom.)		10	B		See drawing on Page 6
C out (nom.)		3.4	B		
C g'g" (nom.)		1.2			
C a'a" (nom.)		0.24			

<u>NOTES</u>	<u>MOUNTING POSITION</u>
<p>A. Centre tapped heater (series connected 12.6v 0.9A)</p> <p>B. Each Section</p> <p>C. Temperature measured at the junction of glass and pins. The valve may be operated at full ratings up to a frequency of 100 Mc/s with only normal radiation and convection cooling. Above this frequency or in poorly ventilated conditions, a minimum air flow of 5 c.ft./min. shall be directed onto the top of the envelope to ensure operation within the specified limits.</p>	Any

NOTES

1. Test each section separately with g1 of the non-active section biased to -100v. Heaters parallel connected.
2. Read after a minimum period of three minutes operation when the measurement shall neither be rising nor out of limit.
3. The two sections connected in parallel.
4. At a circuit efficiency of 80%.
5. The valve shall be vibrated sinusoidally at f = 50 cps. in each of the following planes:-
  - (a) Major axis
  - (b) Transversely in the planes of the anodes.
  - (c) Transversely, perpendicular to the planes of the anodes.
6. The change in mutual conductance is expressed as:  

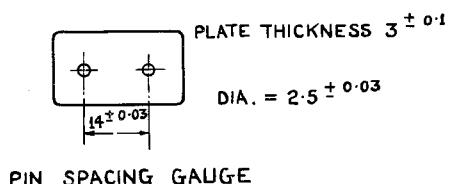

$$\frac{gm \text{ at } 6.3v - gm \text{ at } 5.7v}{gm \text{ at } 6.3v} \times 100\%$$
7. Preheat the valves for five minutes under the test conditions before making the test.
8. The life test is to be performed in an approved dynamic circuit.
9. The Inspection Level of IC is applicable to production quantities in excess of 1000 valves. Where orders are for less than this quantity, the life test specified in K1001 Section 13 shall apply.
10. The connections for the capacitance test shall be as follows:-

TEST	H.P	LP	E
Ca'gl"	TC1	6	1, 2, 3, 4, 5, 6, 7
Ca'gl'	TC2	13457C	TC1, TC2 6
