## NOTES

1. Clockwise rotation of the tuner increases the frequency. The tuner torque is 20oz in (0.14Nm) max. **Warning** No stops are fitted to the tuner and tuning beyond the specified frequency range may damage the klystron.
2. The resonator is normally operated at earth potential and in good thermal contact with the waveguide system.
3. All voltages except the heater voltage are with respect to cathode.
4. The reflector circuit impedance must not exceed  $0.5M\Omega$ . The reflector must never become positive with respect to cathode.
5. For best life, the operating temperature of the klystron body should be kept as low as possible.
6. Measured between 4 and 15 minutes after switching on all supplies, at  $8750 \pm 20\text{MHz}$ .
7. With a mismatch of v.s.w.r. 1.5:1, varied through all phases.
