

## TH 338 TRIODE

The TH 338 is a forced air cooled, ceramic metal, high gain triode of planar structure. It is specially designed for highly linear amplifier operating up to 1000 MHz without grid current in T.V. translators handling both sound and vision signals in the same channel with a crossmodulation level better than 52 dB.

The anode can dissipate 1200 W.

### GENERAL CHARACTERISTICS

#### Electrical

Type of cathode .....	oxide coated	
- Heating .....	indirect	
Heater voltage (1) .....	6.3 ± 2 %	V
Heater current, approximate .....	5.5	A
Minimum preheating time .....	3	mn
Interelectrode capacitances (2) :		
- grid-anode .....	7.7 to 8.7	pF
- grid-cathode (cold) .....	16	pF
- cathode-anode (cold) .....	0.13	pF
Amplification factor, approximate .....	80	
Transconductance ( $I_a = 250$ mA) .....	45	mA/V

#### Mechanical

Mounting position .....	any	
Anode cooling .....	forced air	
Minimum airflow .....	see curves page 3	
Corresponding air pressure drop .....	see curves page 3	
Maximum inlet air temperature .....	45	°C
Maximum outlet air temperature .....	100	°C
Maximum temperature of electrode terminals (3) .....	250	°C
Net weight, approximate .....	1200	g
Dimensions .....	see drawing	

**THOMSON-CSF**  
GROUPEMENT TUBES ELECTRONIQUES

## OPERATING CONDITIONS

### Maximum ratings

Anode D.C. voltage .....	2.8	kV
Grid D.C. voltage .....	-200	V
Peak cathode current .....	2.5	A
Anode D.C. current .....	0.6	A
Anode dissipation power .....	1 200	W
Frequency .....	1 000	MHz

**CLASS A - LINEAR AMPLIFIER FOR TELEVISION TRANSLATOR  
HANDLING BOTH SOUND AND VISION SIGNALS  
C.C.I.R. STANDARD**

### Typical operation

Operating frequency .....	780	MHz
Heater voltage .....	5.7	V
Anode D.C. voltage .....	2.4	kV
Anode D.C. current .....	0.4	A
Gain .....	16	dB
Peak video power .....	220	W
Crossmodulation level (3 tones test) .....	> 52	dB*

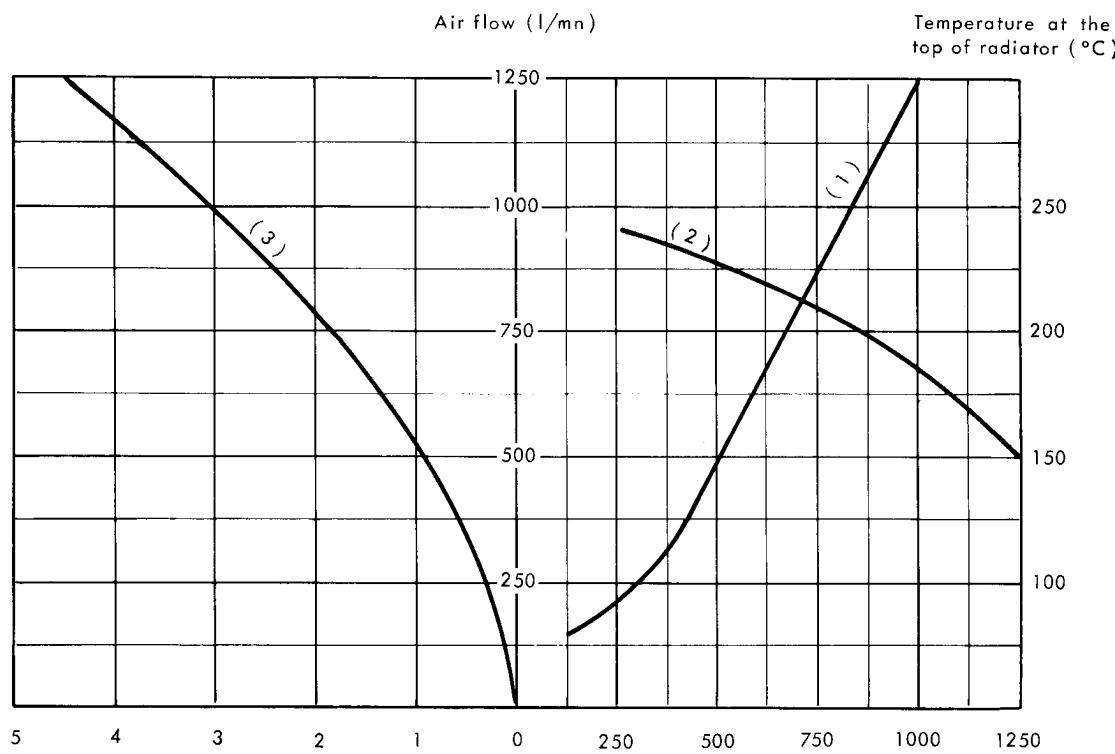

\* Under Video level.

## NOTES

- 1 - In high frequency operation, the cathode is subjected to considerable back bombardment which raises its temperature. After the circuit has been adjusted for proper tube operation, the heater voltage must be reduced to prevent overheating of the cathode with resulting short life. Please ask for information for any special application.
- 2 - Measurements are made in appropriate mounting with minimum parasitic capacitances.
- 3 - For maximum tube life, this temperature must not exceed 200 °C. The cooling airflow must be established before application of any electrode voltage.

## ANODE COOLING CHARACTERISTICS

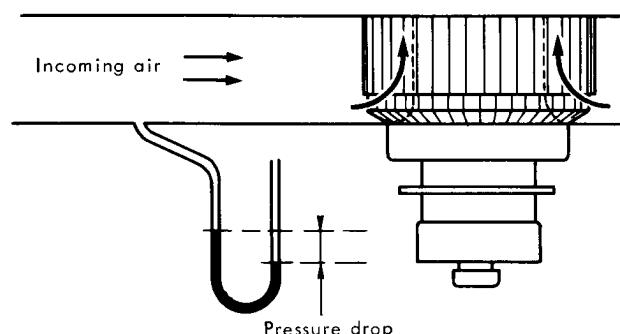

(1) Airflow versus anode dissipation power

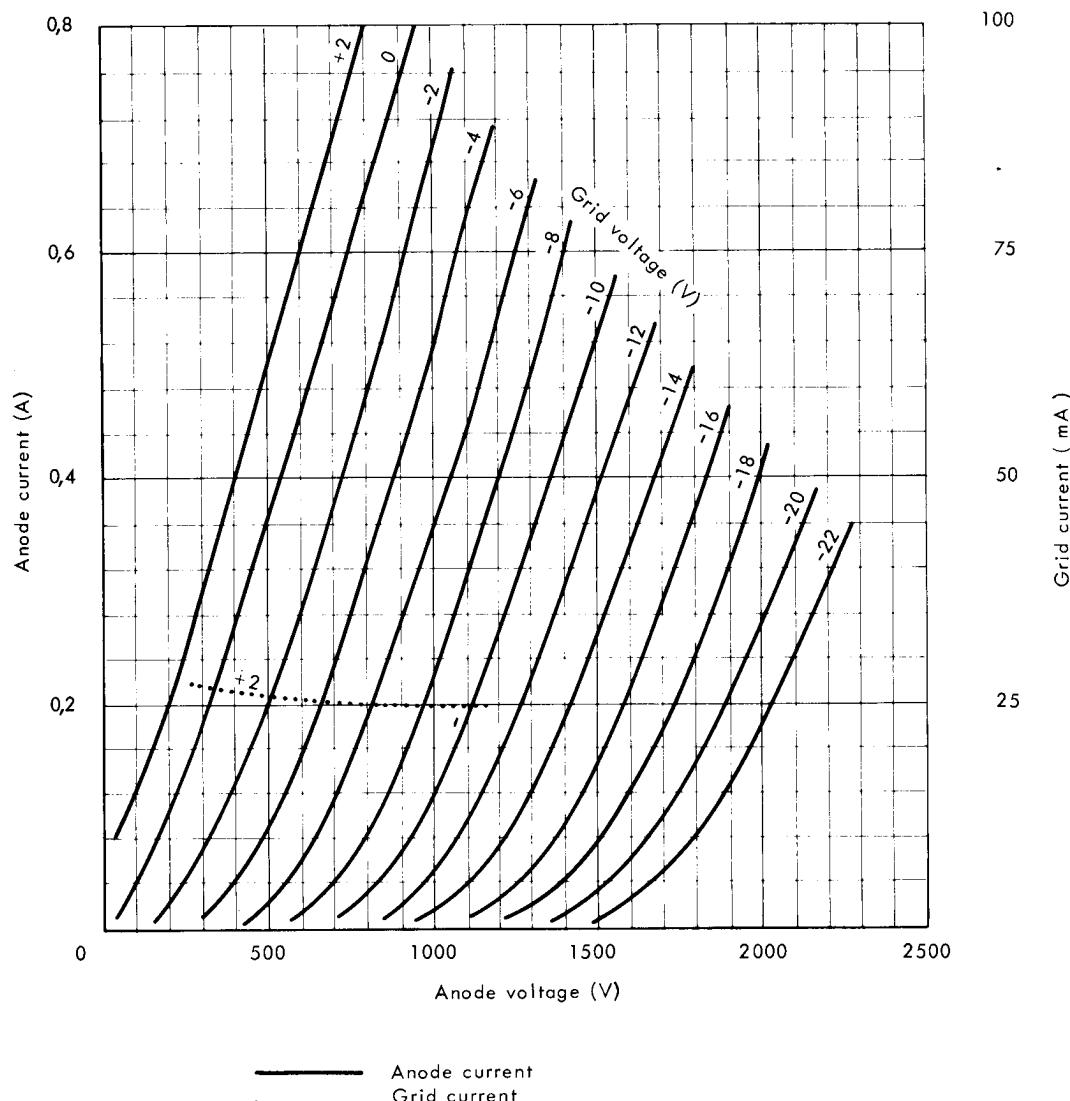

(2) Temperature measured at the top of the radiator versus anode dissipation

(3) Pressure drop at the entrance of anode cooling system versus airflow;

the temperature of incoming air at the entrance is 25°C and the air pressure is 1 bar.
