

IGNITRON

Temperature Controlled

The GL-6347 ignitron is a sealed, stainless-steel-jacketed, water-cooled, mercury-pool tube especially suited to resistance-welding-control service. In this service two tubes in the inverse-parallel connection will control 1200 kilovolt-amperes at voltages of 250 to 600 volts over the frequency range of 25 to 60 cycles. The ability of this tube to carry very high peak currents for short periods makes it especially suited to such service.

Ease of installation, economical use of space, and reliability of operation are assured by design and construction features inherent in the steel-jacketed construction.

This tube is identical in ratings and characteristics to the GL-5552/FG-235-A. Mechanically, it has the additional feature of an integral temperature-control device with protective features. The control includes a switch which operates a solenoid valve in the water-supply line to the tube in response to increasing and decreasing tube temperature, thus maintaining the amount of cooling

water to the minimum required by the operating conditions. An over-temperature switch is included to remove power from the ignitron when its temperature exceeds a safe value. In applications where the cooling water flows through two tubes in series, this tube can be used with the GL-5552/FG-235-A since the GL-6347, in the position nearer the water drain where it receives the warmer water, can control the flow to both under normal conditions.

This new construction prevents excessive condensation over the external parts of the tube under conditions of high humidity. Another advantage is the appreciable saving in maintenance costs over tubes of the old design since this control feature, in addition to greatly reducing the amount of water required, eliminates the necessity for such safety devices as water-flow relays, water over-temperature relays, and water-pressure interlocks required with the older design tubes. The GL-6347 ignitron is equivalent to a 600-ampere magnetic contactor.

TECHNICAL INFORMATION

GENERAL

Electrical

Cathode excitation—cyclic	
Cathode spot starting—ignitor	
Number of electrodes	
Main anodes.....	.1
Main cathodes.....	.1
Ignitors.....	.1
Arc drop at 6800 peak amperes.....	.28 volts
Arc drop at 440 peak amperes.....	.14 volts
Cathode excitation requirements	
Ignitor voltage required to fire.....	.200 volts
Ignitor current required to fire.....	.30 amperes
Starting time at required voltage or current.....	.100 microseconds

Mechanical

Envelope material—metal	
Net weight.....	.8 pounds

Thermal

Type of cooling—water	
Inlet water temperature, minimum.....	.10 C
Inlet water temperature, maximum.....	.30 C
Water flow, minimum, solenoid water valve open.....	.1.5 gallons per minute
Characteristics for water cooling at rated minimum flow	
Water temperature rise, maximum.....	.6 C
Pressure drop at 1.5 gallons per minute, maximum.....	.4.5 pounds per square inch

MAXIMUM RATINGS AND TYPICAL OPERATION

Power-rectifier service, intermittent duty

Ratings are for zero phase-control angle—see curve for details.

Maximum peak anode voltage

Inverse.....	.500 volts
Forward.....	.500 volts

Maximum anode current

Peak.....	.1600 amperes
Average.....	.100 amperes
Maximum averaging time.....	.6 seconds
Fault.....	.6000 amperes
Maximum duration of fault current.....	.0.15 second
Frequency range.....	.25-60 cycles per second

Resistance-welding-control service*

Two tubes in inverse parallel, ratings per tube

Voltage range.....	.250 to 600 volts rms
Maximum demand.....	.1200 kilovolt-amperes
Average current at maximum demand.....	.75.6 amperes
Maximum average current.....	.140 amperes
Demand at maximum average current.....	.400 kilovolt-amperes
Maximum averaging time at 600 volts rms.....	.5.8 seconds
Maximum averaging time at 250 volts rms.....	.14.0 seconds
Maximum peak fault current at 250 volts.....	.13450 amperes
Maximum peak fault current at 600 volts.....	.5600 amperes

TECHNICAL INFORMATION (CONT'D)

MAXIMUM RATING AND TYPICAL OPERATION (Cont'd)

Ignitor

Maximum voltage	
Positive—anode voltage	
Negative.....	5 volts
Maximum current	
Peak.....	100 amperes
Root mean square.....	10 amperes
Average.....	1 ampere
Maximum averaging time.....	5 seconds

Temperature-control-switch ratings†

Maximum voltage.....	575 volts
Maximum current.....	3 amperes
Maximum potential of tube water cylinder	

Above ground..... 1500 volts peak

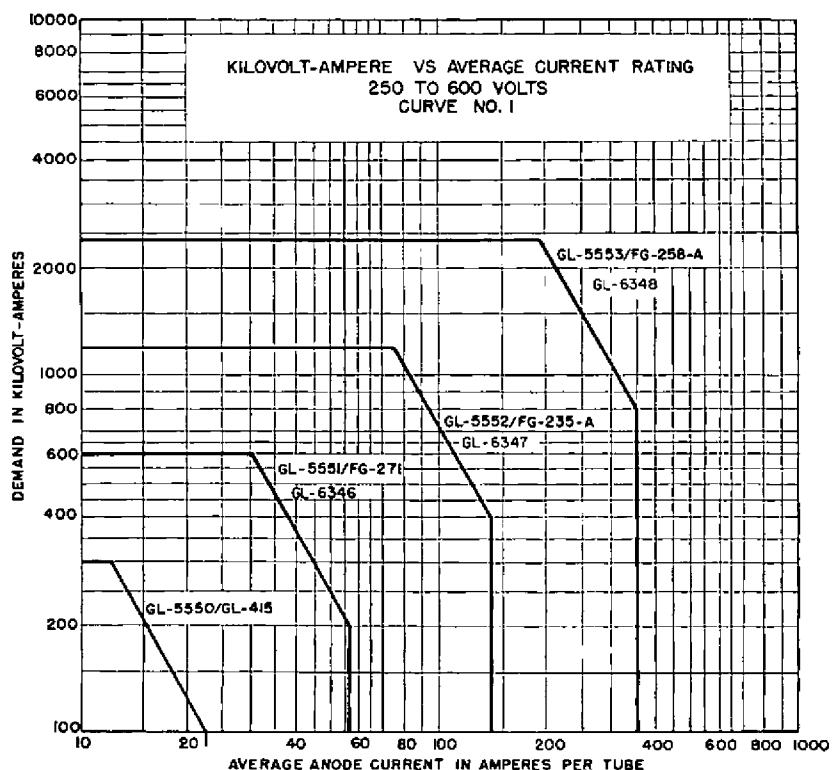

Switch-contact arrangement

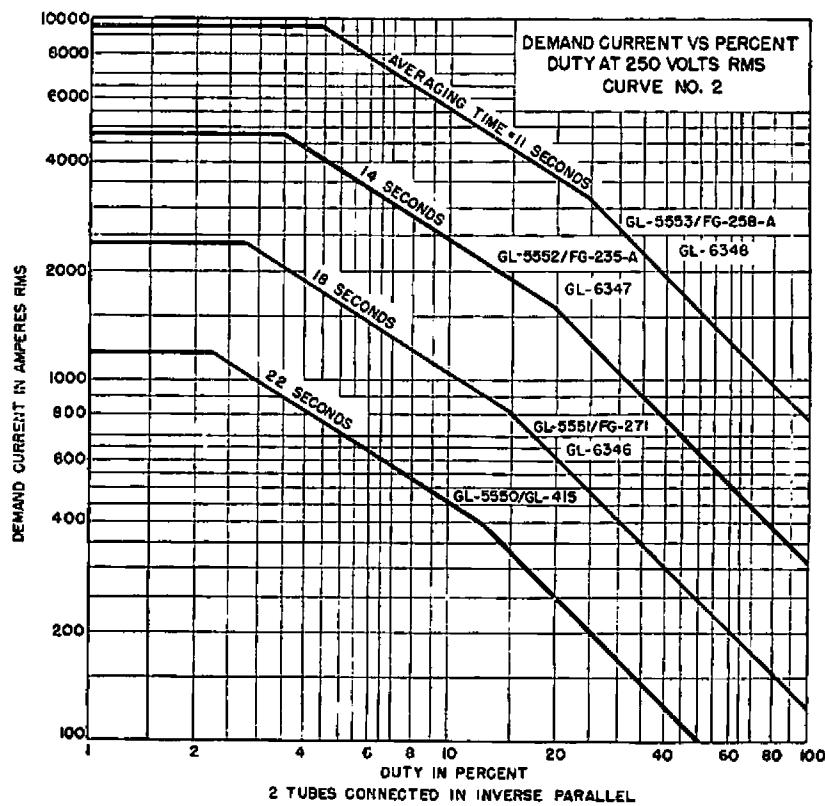

Over-temperature switch—normally closed
(Contacts open on temperature rise)

Water-control switch—normally open
(Contacts close on temperature rise)

* RMS demand voltage, current, and kilovolt-ampere demand are all on the basis of full-cycle conduction (no phase delay) regardless of whether or not phase control is used. For voltages below the minimum, the minimum-voltage current rating applies. With the use of log-log paper straight-line interpolation between tabulated points may be used for other detailed ratings of: Demand kva vs average anode current. Maximum averaging time vs anode voltage.

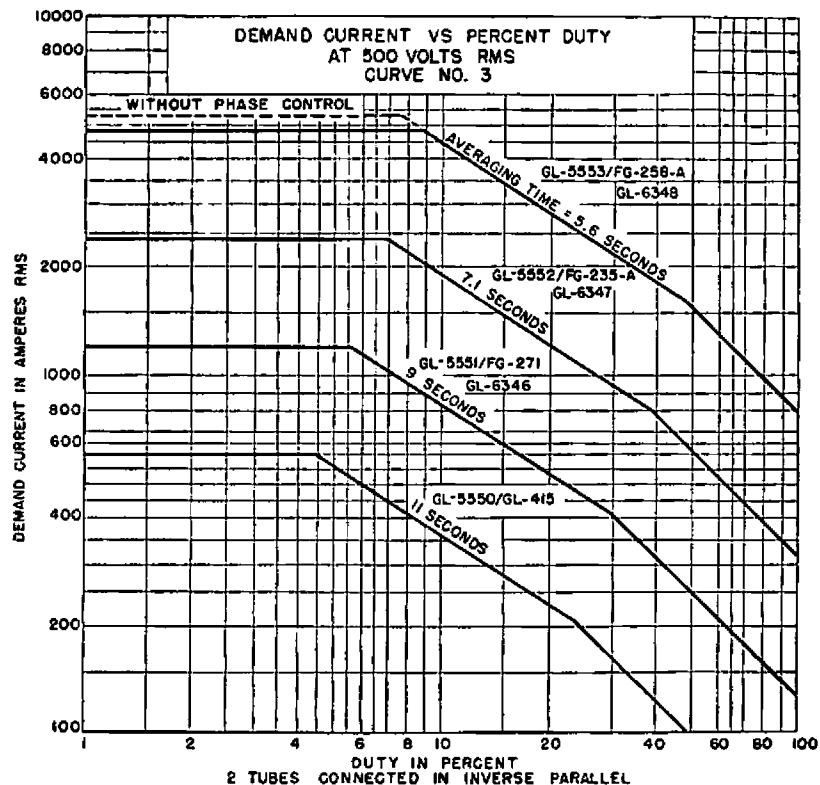

† Suitable fuses should be provided in the switch circuits to prevent a power arc should a ground occur in the switch or wiring.
